SOLID Principle

Code :

Program.cs

The screenshot shows the Visual Studio IDE with the 'Sampleproject_solidprinciple' solution open. The 'Program.cs' file is selected in the Solution Explorer and is open in the editor. The code defines a 'Main' method that initializes a list of handlers, an email service, an order repository, and an order processor. It then creates an 'Order' object with 'ProductType' set to 'Online' and 'Amount' set to 158.0, and finally calls 'processor.ProcessOrder(order)'.

```
using System;
using System.Collections.Generic;

class Program
{
    static void Main(string[] args)
    {
        var handlers = new List<IOrderTypeHandler>
        {
            new OnlineOrderHandler(),
            new StoreOrderHandler()
        };

        IOrderRepository repository = new OrderRepository();
        IEmailService emailService = new EmailService();

        var processor = new OrderProcessor(handlers, repository, emailService);

        var order = new Order
        {
            ProductType = "Online",
            Amount = 158.0
        };

        processor.ProcessOrder(order);
    }
}
```

The Output window shows the build process, indicating that the build succeeded and completed at 11:00 and took 07.445 seconds.

Models/Order.cs

The screenshot shows the Visual Studio IDE with the 'Sampleproject_solidprinciple' solution open. The 'Models/Order.cs' file is selected in the Solution Explorer and is open in the editor. The code defines a 'ProductType' property and an 'Amount' property for the 'Order' class.

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;

namespace Sampleproject_solidprinciple.Models
{
    public class Order
    {
        public string ProductType { get; set; }
        public double Amount { get; set; }
    }
}
```

The Output window shows the build process, indicating that the build succeeded and completed at 11:00 and took 07.445 seconds.
